

# HireHub -- Eclipse Setup & Deployment Guide

## How to Clone, Import, Configure Database, and Run HireHub in Eclipse IDE

GitHub Repository: <https://github.com/anujkandalkar/HireHub.git>

### 1. Prerequisites & System Requirements

Before starting, ensure you have the following installed on your machine:

- Eclipse IDE for Enterprise Java and Web Developers (2022-09 or newer)
- Java Development Kit (JDK 11, JDK 17, or JDK 21)
- Apache Tomcat Server (v9.0 or v10.1)
- MySQL Server 8.0+ & MySQL Workbench (or Command Line Client)
- Git (or GitHub Desktop)

### 2. Step 1: Clone the GitHub Repository

Open your Command Prompt (Windows) or Terminal (macOS/Linux) and run:

```
git clone https://github.com/anujkandalkar/HireHub.git
cd HireHub
```

This clones the entire HireHub source code, servlets, JSP views, CSS architecture, and database scripts to your local system.

### 3. Step 2: Set Up MySQL Database & Import Schema

1. Open MySQL Workbench or MySQL Command Line Client.
2. Create the target database schema:

```
CREATE DATABASE hirehub_db;
```

3. Import the database schema from the database/schema.sql file:

```
USE hirehub_db;
SOURCE database/schema.sql;
-- Or via Command Prompt:
mysql -u root -p hirehub_db < database/schema.sql
```

This script initializes tables: users, students, companies, jobs, applications, interviews, tasks, and notifications.

### 4. Step 3: Import HireHub Project into Eclipse IDE

1. Open Eclipse IDE for Enterprise Java.
2. In top menu, click File -> Import...
3. Expand General and choose Existing Projects into Workspace.
4. Click Next, then click Browse... and select your cloned HireHub folder.
5. Confirm HireHub is selected in the Projects list, and click Finish.

### 5. Step 4: Configure Database Credentials in Java

1. In Eclipse Project Explorer, open: src/main/java -> com.hirehub.util -> DBConnection.java
2. Update the JDBC URL, Username, and Password variables to match your local MySQL configuration:

```
private static final String URL = "jdbc:mysql://localhost:3306/hirehub_db";
private static final String USER = "root";
private static final String PASSWORD = "YOUR_MYSQL_PASSWORD";
```

3. Save the file (Ctrl + S).

### 6. Step 5: Configure Apache Tomcat Server in Eclipse

1. Open the Servers tab at bottom of Eclipse (Window -> Show View -> Servers).
2. Click "No servers are available. Click this link to create a new server..."
3. Expand Apache -> select Tomcat v9.0 Server (or v10.1 Server) -> click Next.
4. Click Browse... and select your local Tomcat Installation Directory.
5. Select your Java Runtime Environment (JRE/JDK) and click Finish.

### 7. Step 6: Add HireHub to Tomcat & Run Application

1. Right-click Tomcat Server in Servers tab -> Add and Remove...
2. Select HireHub from Configured apps -> click Add > -> click Finish.
3. Right-click HireHub in Project Explorer -> Run As -> Run on Server.
4. Select your Tomcat Server and click Finish.
5. Open your web browser to test:

`http://localhost:8080/HireHub/`   OR   `http://localhost:8080/`

### 8. Troubleshooting & Common Fixes

#### A. Port 8080 Conflict:

If Tomcat complains port 8080 is in use, double-click Tomcat in Servers tab and change HTTP Port to 8081.

#### B. Missing MySQL JDBC Connector JAR:

Ensure mysql-connector-j-8.x.jar is present under WebContent/WEB-INF/lib/ or src/main/webapp/WEB-INF/lib/.

#### C. CSS Styles Not Refreshing:

Press Ctrl + F5 in your browser to hard refresh stylesheets (header.jsp uses ?v=2 cache-busting).
